

Zeroing the page's CoT reading did not stop the uploads

Five forgery pages · vector added at block 11 to every fetched-page token · outcome is a receiver receipt, not a judge

Behavior · same 5 pages, same seeds

Readout · layer-12 probe

Left: uploads verified by the mock receiver. Hatched bar: episodes that spent the 4,096-token budget before fetching the page.

Right: what the paper's five-role probe reads on the same page tokens after the edit. The role vector removed CoT and made the page read as User, not Tool. α is in units of the Tool-CoT class-mean gap (38.5; residual norm $\approx 1,280$). Random vector has the same norm. $n = 5$ pages per arm; no interval is drawn.
