

The model labels page instructions as the user's; only a sentence moved it

140 paired episodes, September 2026 permission task · regex-coded reasoning · matched outcomes from the earlier report

Left: share of reasoning traces attributing a page-borne instruction to the user, by the wrapper the attacker wrote. Steering arms are not separable here.
Right: unwanted writes prevented and introduced against the matched baseline. The reminder is one developer sentence; the vectors are block-11 edits.
Pair counts differ by arm (20 to 22). One Toolward "prevented" is a malformed generation; the reminder also lost 2 permitted completions.
